SPECIAL NOTE

Your new Wedgelock Coupler fitted with the I-LOCK™ Safety Device requires the installation of a third hydraulic line - please follow the instructions carefully.

Please read this Installation Manual thoroughly before you commence installation of the I-Lock Coupler. Deviating from these instructions may result in increased install time and / or damage to the hydraulic kit, carrier machine or attachment.

1.0 CHECK LIST

Before you start check the following

• Check the contents of the installation components supplied.

• Ensure that the components are correct for the carrier machine that the coupler is to be installed.

• Check that the carrier machine is positioned on level ground.

• Check that you have absorbent materials available to soak up any fluid spills.

• Dispose of any used materials in a safe and environment friendly manner.

• Power off the carrier machine. If the machine has been working ensure that it has cooled down adequately prior to commencing any part of the installation procedure.

• Before carrying out any welding on the carrier machine disconnect the battery. Refer to the carrier machine operator / maintenance manual.

• Ensure that the pressure in the hydraulic system is relieved before opening any hydraulic lines.
Please ensure you follow the stated precautions below while carrying out the coupler and hydraulic kit installation procedure.

2.0 SAFETY PRECAUTIONS

- Always use PPE (Personal Protective Equipment) when servicing, operating or maintaining plant, machinery and its components.

- Refer to the carrier machine “Service Manual” for correct procedures when carrying out work on the machine. The machine service manual takes precedence over any discrepancies between that and this installation manual.

- Allow for hydraulic oil to cool adequately before opening or accessing any hydraulic lines. Hydraulic lines, fittings and components can be hot which can be harmful causing severe burns.

- Relieve the hydraulic tank pressure before accessing hydraulic lines. Refer to the carrier machine service manual for proper procedures.

- Ensure that the stick of the carrier machine is resting on the ground at all times – do not leave attachments suspended in the air during service / installation.

- Check and tighten all fittings, hose connections and joints within the hydraulic quick coupler circuit prior to activating the machine.

- Visually inspect for oil leaks tighten and adjust accordingly. Avoid contact with hydraulic fluids and high pressure oils – use cardboard or similar as a backing when checking for leaks.

- Oil spills are sometimes unavoidable. Contain all fluid spills with appropriate absorbent materials and dispose accordingly. Immediately clean affected areas to minimize safety risks.

- When operating plant and machinery keep people and property well out of harms way. Evaluate the working environment and identify hazards. Ensure that all people involved in the installation understand the hazards associated with this procedure.

2.1 WELDING PRECAUTIONS

- Before commencing any welding procedures on the carrier machine ensure that the engine is turned off and the battery supply is disconnected (refer to the carrier machine service manual).

- Ensure all surrounding areas are protected with a flame resistant covering. Clear surrounding areas of combustible materials. Ensure you have a fire extinguisher at hand.

- Cover highly susceptible surfaces like cylinder rods, glass windows, electrical components and plastics to prevent spatter or heat damage.

- Connect the ground cable (earth lead) from the welder to the component to be welded to the carrier machine.

- Ensure parts and surfaces to be welded are clean and prepared properly for welding.

- Use appropriate PPE (Personal Protective Equipment) when carrying out any welding procedures.
3.0 SAFETY DURING COUPLER INSTALLATION

- Always use the correct PPE when removing attachments from carrier machines.
- Stand well clear of machinery that is in motion at all times.
- NEVER place hands or fingers near pin holes or recesses.

- Always use correct tools when carrying out removal and installation of attachments on the carrier machine.
- Use correct lifting techniques and lifting equipment when maneuvering heavy objects.
- Attachments may roll or tip during removal when placed on the ground – place with extreme caution.
- Always use assistance when installing and removing attachments pinned to the carrier machine.

3.1 COUPLER ORIENTATION

The I-Lock Coupler has been designed and manufactured to fit the dipper arm and linkage assembly of the carrier machine. The I-Lock Coupler fits the carrier machine in one orientation only with the C-Section facing the operators view. (see fig 3.0.1)

- Always use the original bucket pins to fit the coupler to the machine. These pins are designed for the dipper arm and linkage assemblies.
- Always replace o-rings to original positions and utilize pin retention systems where applicable.
- **DO NOT** use standard attachment pins to connect the coupler to the machine. If unsure consult your Wedgelock Dealer immediately.
- If a THUMB is/ will be fitted to the carrier machine utilizing the main dipper pin position refer to the THUMB Installation Guide for reference.

---

**Fig 3.1.1 Coupler Orientation**
3.2 REMOVE THE EXISTING BUCKET

- Before you fit the coupler to the carrier machine you have to first remove any existing attachment from the dipper arm. (Fig 3.2.1)

- Place the bucket or attachment in a safe position on the ground.

- Undo the pin retention systems holding the dipper pin and link pin in their position.

- Gentle raise the bucket off the ground and rotate the cylinder until the weight is off the dipper pin.

- Remove the dipper pin and place in a clean area.

- Lower the bucket to the ground with the crowd cylinder until there is no longer weight on the link pin.

- Remove the link pin and place in a clean place.

3.3 FITTING THE COUPLER (Link Pin)

- Ensure the coupler is sitting on a flat surface in the correct orientation.

- Align the dipper arm of the carrier machine with the coupler.

- Position the o-rings for the linkage boss assembly on the linkage boss (if fitted).

- Using the bucket curl cylinder lower the linkage into position on the rear boss of the coupler (Fig 3.3.1).

- Align the coupler if necessary using a bar or lever.

- Insert the linkage pin through the coupler boss and linkage boss.

- Align pin retention system and fix linkage pin into place.

- Locate the o-rings into the correct position (if fitted).

- NOTE – ORIGINAL OEM LINKAGE PIN MUST BE USED.
3.4 FITTING THE COUPLER (Dipper Pin)

- Place o-rings over ear plates of coupler to hold in position until ready for final placement.
- Carefully raise the dipper arm of the carrier machine so that the weight of the coupler is off the ground. Ensure that the dipper arm is in a vertical position. (Fig 3.4.1).
- Retract the bucket curl cylinder until the coupler front boss aligns with the dipper pin hole. The coupler will balance allowing an easy insertion of the main dipper pin.
- Align pin retention system and fix dipper pin into place.
- Grease both the dipper pin and the linkage pin.
- Rotate coupler through full rotation to check clearances.
- NOTE – ORIGINAL OEM DIPPER PIN MUST BE USED.

Fig 3.4.1 Raise dipper arm to take weight off coupler
Fig 3.4.2 Retract bucket curl cylinder to align dipper pin

CAREFULLY ROTATE THE COUPLER THROUGH FULL ROTATION TO CHECK CLEARANCES
IF THERE ARE ANY SIGNS OF INTERFERENCE STOP IMMEDIATELY AND CONTACT YOUR WEDGELOCK DEALER
There are three main sections to the hydraulic kit installation which consists of:

- Fitting of the Junction Manifold Block to the dipper arm.
- Fitting of the I-Lock Control Valve in the engine/pump compartment.
- Routing the 3 Line Hydraulic Circuit to complete the hydraulic part of the coupler installation.

### 4.0 JUNCTION MANIFOLD POSITION

The Junction Manifold block is a 9 port block designed to enable multiple routing options and variable positional options to optimize the jumper hose routing at the base of the dipper arm. Note correct orientation. (Fig 4.0.1)

- Positioning of the Junction Manifold Block and the hose routing option is critical to the life cycle of the jumper hoses. (Fig 4.0.2)

- To determine the optimum position of the Junction Manifold Block first rotate the bucket curl cylinder through full rotation to check available clearances for the manifold at both full stroke and zero stroke.

- The manifold should be placed as close as possible to the main dipper pin to minimize jumper hose length – when utilizing universal jumper hose kits any excess jumper hose can be then contained inside the coupler body.

### 4.1 FITTING THE JUNCTION MANIFOLD BLOCK

- Once the optimum position has been determined, clean and prepare the surface of the dipper arm to be welded.

- Lightly tack the manifold into position, carefully tacking only the ends of the manifold. (Refer to welding precautions and carrier machine service manual for welding instructions).

- Fit one adaptor to the manifold and route one jumper hose from the manifold to the coupler cylinder.

- Rotate coupler SLOWLY through full rotation checking that the hose can move freely and is not subject to pinching or crushing at any point. Re-position manifold if required.

- Remove jumper hose, stitch weld the ends ONLY of the manifold block to the dipper arm. (Fig 4.1.1 Stitch weld location)

- Touch up paint finish on welded component to match carrier machine color.
4.2 THE I-LOCK CONTROL VALVE

The I-Lock Coupler is designed to operate on the carrier machine’s MAINS PRESSURE supply. The I-Lock Control Valve controls the oil pressure and oil flow to the coupler for both the Primary Wedge function AND the Safety Knuckle function. The I-Lock Coupler Control Valve MUST BE USED for any installation of an I-Lock Coupler.

- The I-Lock Control Valve consists of twin solenoid valves, two pressure reducing valves and 5 ports for hose routing. The distinguishable markings are there to assist with the electrical connection and hose routing to ensure that the coupler operates in accordance with which it has been designed. (Fig 4.2.1)

- The markings on the control valve are as follows.

  Twin Solenoid Valves
  - SAFETY – safety knuckle solenoid.
  - WEDGE – primary wedge solenoid.

  Two Pressure Reducing Valves
  - 1. PRV set to 240 Bar
  - 2. PRV set to 145 Bar

  5 Ports for hose routing
  - P – pressure in.
  - T – tank return.
  - RET – primary to hydraulic tank line.
  - EXT – primary wedge extend.
  - SAFETY – safety knuckle release.

- For pressure settings refer to the pressure settings chart on page 20.
- For service details regarding the control valve refer to the service section in the Operators Manual.

4.3 INSTALLING THE CONTROL VALVE

- Identify the pump that delivers flow to the BUCKET CURL CYLINDER of the carrier machine. This is the most common pump used for hydraulic couplers operating on mains pressure (refer to the carrier machine service manual if required).

- Utilizing the mounting plate supplied determine a suitable location in the pump / engine compartment of the carrier machine to mount the control valve. The mounting plate can either be welded or bolted into position. (Fig 4.3.1 Mounting Plate)

- Bolt the Control Valve to the mounting plate with the bolts provided.

NOTE: The best position for mounting of the control valve may be determined after the hose routing from the boom to the pump compartment. Check where the hoses exit from the boom end in the pump compartment before mounting the valve as the I-Lock hoses will invariable follow this same route.
4.4 HOSE ROUTING

Wedgelock Hose Kits have been designed to improve the speed and ease in which an installer can fit the hydraulic kit. The content of the hydraulic hose kit has been pre determined to ensure that, in most cases, the majority of fittings required to complete the install are provided. In some circumstances additional fittings may have to be sourced to complete the connection to the pump test port and tank return. For information regarding the port type at these locations please refer to the carrier machine service manual.

The “Pre-Crimped” Wedgelock hose kits are color coded at each end of the pre-crimped hoses. Following the Installation Reference Card will assist with identifying each of the hoses to be routed in respect to their relative positions on the carrier machine. Once the manifold block and solenoid control valve are in position begin routing the hoses from the coupler end of the machine to the engine compartment end.

If using a “Pre-Crimped” Hose Kit follow the instructions ensuring that each color coded hose is positioned as required. If using a ‘Lose Fitting Kit” you can use the color coded instructions as a guide to achieve the same results.

4.5 HOSE ROUTING – DIPPER ARM

- Connect the “Jumper Hoses” from the quick coupler cylinder to the junction manifold block mounted on the dipper arm. Use jumper hoses, nylon abrasion sleeve and fittings provided which are color coded YELLOW. Note which hoses are connected to which ports on the quick coupler cylinder as these will have to match the port options on the valve in the engine compartment.

- Connect the “Dipper Arm” hoses to the junction manifold block using the hoses and fittings color coded BLUE. Route these hoses along the upper side of the dipper arm.

- Determine best position for the hose clamps provided. Prepare surface of the dipper arm for welding the clamps into position. Weld clamp assemblies ensuring that only the vertical ends of the clamp brackets are welded. Touch up paint the dipper arm and clamp to match the carrier machine color. (Fig 4.5.1)

- During clamp welding procedure ensure that the dipper hoses are placed in a clean and safe position away from heat and the welding area.

- Lightly clamp dipper arm hoses into position, do not fully tighten at this stage. (Fig 4.5.2)
4.6 HOSE ROUTING – BOOM

- Fit the nylon abrasive sleeve over the loose ends of the Dipper hoses. Using the GREEN color coded hoses for the Boom, connect these to the dipper arm hoses. (Fig 4.6.1)

- Lay the Boom hoses along the top of the boom arm in preparation of determining the best hose clamp position for this part of the installation. (Fig 4.6.2)

- Mark the position of the top hose clamp on the boom, allowing for the hose to follow the boom movement relative to the dipper arm movement on the top pivot point. Following the existing hose route and length through this pivot area is recommended.

- Mark the position of additional hose clamps along the top of the boom. Prepare the surface of the boom for welding in these locations. Weld clamp assemblies ensuring that only the vertical ends of the clamp brackets are welded. Touch up paint the boom and clamp to match the carrier machine color.

- Tighten all hose joints between the coupler cylinder and the dipper arm to boom connections.

- Tighten the clamp assemblies, pulling through any excess hose, working from the dipper end to the bottom of the boom. Allow “hose slack” for pivot movement and ensuring that the hose assemblies are not stressed in any way. Use cable ties where required.
4.7 HOSE ROUTING – BOOM TO VALVE

- Connect the RED color coded hoses for the Boom to Valve to the boom hoses at the base end of the boom.
- Route the hoses through to the pump compartment towards the control valve following the existing hose routing from the boom end.
- Trace the hoses from the quick coupler cylinder right through to the end where they connect to the valve to determine the correct hose for each port position on the valve.
- Connect the hose ends to the control valve ensuring that they are connected to their respective port positions relative to the cylinder.
- Cable tie Boom to Valve hoses to existing hoses where appropriate and coil any excess hose in the pump compartment. Ensure that the hoses are not bound up or under any strain.
- Tighten all hose joints and fittings between the lower boom end and the control valve.

4.8 HOSE ROUTING – VALVE TO PUMP / TANK

- Using the BLACK color coded hoses from the install kit connect the hose ends to the valve marked P (Pump) and T (Tank).

The supplied Check Valve should be connected directly to the “P” (Pressure) port on the I-Lock Control Valve with the fittings provided in the kit. (See Control Valve Assy Fig 4.2.1)

- Utilizing a “TEST PORT” on the pump that delivers hydraulic pressure to the bucket curl cylinder circuit (see 4.3 above) connect the hose from the check valve on the “P” port to the test port.
- Locate an existing tank line hose on the main return manifold or hydraulic tank. Disconnect the existing hose and install a tee fitting.
- Reinstall the existing hose onto one end of the tee and then connect the new tank line hose from the control valve “T” port to the other end of the tee.
- Cable tie hoses to existing hoses where appropriate and coil any excess hose if required. Ensure that the hoses are not bound up or under any strain.
- Tighten all hose joints and fittings between the control valve and the pump and tank.

NOTE 1: When utilizing a “Pre-Crimped” or “Loose” hose kit supplied by Wedgelock we have endeavored to supply the majority of the fittings required to carry out a complete install of an I-Lock Coupler, however due to the vast array of different carrier machines, fitting types and port sizes, not all circumstances may be accounted for. In instances where the fittings supplied do not match the port size or the type of carrier machine that this install is being carried out on please contact your nearest machinery dealer or hydraulic fittings provider for the additional appropriate component(s).

NOTE 2: See Hydraulic Schematic (Fig 6.0.1)
5.0 ELECTRICAL INSTALLATION

The I-Lock Coupler must be operated utilizing the I-LOCK CONTROLLER, DUAL SWITCH ASSEMBLY and SOLENOID LOOM. The proprietary electrical components have been designed in conjunction with the functionality and operation of the coupler safety features. The built in “Timer” and “Operational Sequences” controlling the solenoid valves are features which provide the operator and fellow co-workers a safe work environment during attachment change over.

Failure to utilize the proprietary electrical components with the I-Lock Coupler could result in coupler malfunction, causing serious harm or even death. (Fig 5.0.1 & 5.0.2 & 5.0.3)

The I-Lock Controller, Dual Switch Assembly and Solenoid Loom are designed to enable a “plug & play” electrical installation process.

- Determine a suitable position for the I-Lock Controller. Ensure the position is a dry location and easily accessible. Mount into position. (Caution - Do not over tighten fixing screws)
- Find two spare locations in the machine console, preferably side by side, to insert the dual rocker switches.
- Route the switch wires to the I-Lock Controller. Connect the corresponding male spade fitting to the female connector on each of the assemblies.
- Locate a switched (fused) power source from within the console of the carrier machine. Connect the RED power lead on the Dual Switch Assembly to the power source.
- Find a suitable earth location (negative) and connect the BLACK wire from the I-Lock Controller.
- Plug the Solenoid Loom into the I-Lock Controller.
- Route the Solenoid Loom from the I-Lock Controller position through to the engine compartment where the I-Lock Solenoid Valve is located.
- Connect the RED labeled DIN Plug to the “WEDGE” solenoid.
- Connect the BLACK labeled DIN Plug to the “SAFETY” solenoid.
- Ensure that all electrical looms are routed and fixed securely using cable ties where required.
- NOTE: See Electrical Assembly (Fig 6.2.2)
SECTION 6: ASSEMBLIES

6.0 LOOSE HOSE KIT ASSEMBLY

Fig 6.0.1 Loose Hose Kit Assembly

6.1 PRE-CRIMPED HOSE KIT ASSEMBLY

Fig 6.1.1 Pre-crimped Hose Kit Assembly
6.2 ELECTRICAL ASSEMBLY

Fig 6.2.2 Electrical Assembly
7.0 FINISH & TEST

Before starting this section, position the machine in the “Oil Level Check” position as suggested by the excavator machine manufacturer. Check the oil level sight gauge on the hydraulic tank. Add hydraulic oil if necessary (refer to the carrier machine service manual for further information).

- Check the hose clamp assemblies and valve mounting bolts are tightened as per the Torque Setting of Metric Bolts & Nuts Chart (Fig 8.0.1)
- Starting at the coupler end thoroughly check that the hose connections are tightened throughout the complete circuit as per the JIC (SAE 37º FLARE) Connection Chart (Fig 8.1.1).
- Clear all personnel and all obstacles from the swing radius area and working parameter of the machine.
- From the seat of the excavator, start the machine and lower the excavator arm to near the ground. In a very slow motion, using the excavator levers, raise the dipper arm and rotate the coupler through full rotation. Then raise the boom of the excavator and motion the dipper arm cylinder to full extension. Now motion the dipper arm cylinder to full retraction, lowering the boom arm in unison. Use this process to check the hose routing throughout the complete circuit. Ensure that the hoses are not under any strain or subject to potential jamming or pinching. Assistance will be required to do this. Modify hose routing if required.
- Running the machine at idle or a low engine RPM setting to supply a low volume of oil through the circuit. Activate the circuit and check for any leaks. Shut down the machine immediately if leaks are detected, then tighten coupler as required and re-check.
- Activate the coupler circuit several times to ensure that the system is working correctly – refer to the I-Lock Coupler Operators Manual.
- Once the test procedure has been completed, touch up paint any welded brackets or assemblies and cable tie any loose hoses.
- Affix “In Cab” Decals in a suitable location within the operators working area. (Fig 7.0.1 In Cab Decals)

8.0 IN CAB DECALS

The following two “In Cab” Decals must be affixed in a suitable location within the operators working area. For replacement decals please call your nearest Wedgelock dealer. (Fig 8.0.1 Warning Decal & 8.0.2 I-Lock Coupler Operating Decal)
9.0 TORQUE CHART – METRIC BOLTS

The following chart gives the standard torque setting of the bolts used in this hydraulic kit installation. It is important to follow the chart when installing bolts and nuts. Failure to do so could result in premature failure, damage to components, or even serious injury. (Fig 8.0.1)

<table>

9.1 TORQUE CHART – JIC CONNECTIONS

JIC (SAE 37° Flare) Connections are a very common connection in fluid power applications. Both the male and female fittings have a 37° seat. The seal takes place between the male flare and the female cone seat. The thread holds the connection mechanically.
